Replace page 12, lines 17-22, as follows:

AS  
At Data Center 30, the authentication keys are not available in plain text, but must be distributed to the mailer. Conventional methods of distributing and updating the authentication key for each mailer can be used. See, for example, previously noted U.S. Patent No. 5,812,666, which describes a key management system for distributing and updating cryptographic keys to the secure boxes and the mailer's PC.

Replace page 19, lines 6-14, as follows:

PA  
Database Server 36 includes records of mail volumes and accounting of postal funds within its database. By accessing Data Center 30, the postal service can perform on-line tracking of selected information available from Data Center 30. Such information includes volumes of mail pieces processed or in process, allocation of funds to originating post offices and meter account use. Such on-line tracking allows the postal service to manage its resources in a more efficient manner. For example, the postal service could identify locations with peak workloads and could determine locations of mail fraud by comparing mail volumes with expected postal revenues.

**In the Claims:**

Please cancel claims 2-8. Please add new claims 9-17 as follows:

9. A system for dispensing postage value comprising:

AP  
a data center communicatively coupled to a remote computer via a network, a user initiating a request to the data center via the remote processor to dispense postage value to be printed by a printer coupled to the remote processor, the data center comprising:

a storage device to store data records, the data records including a user account and a meter account associated with the user;
